**FIG 4.** Crazyflie —High-level System Architecture<sup>2</sup>

<sup>2</sup><https://wiki.bitcraze.io/projects:crazyflie2:architecture:index>

- nRF51822—low power CPU
  - enabling power to the rest of the system
  - battery management and voltage measurement
  - wireless radio (boot and operate)
  - detect and check expansion boards

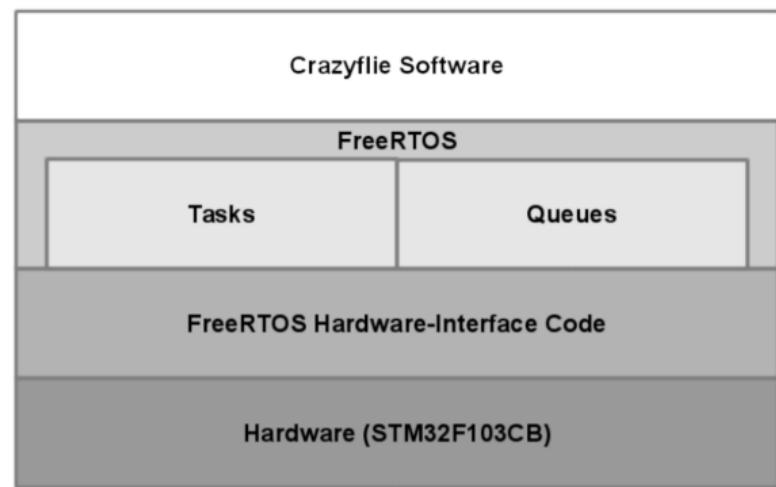

- **nRF51822**—low power CPU
  - enabling power to the rest of the system
  - battery management and voltage measurement
  - wireless radio (boot and operate)
  - detect and check expansion boards
- **STM32F405**—performance CPU
  - brain of the whole drone
  - responsible for flight control
  - Algorithms for DSP, PID etc
  - USB connection
  - User programmable (i.e., extensibility of the drone)

- **nRF51822**—low power CPU

  - USB connection
  - User programmable (i.e., extensibility of the drone)
- **UART**—universal asynchronous receiver / transmitter
  - communication protocol
  - exchange of data packets to and from interfaces (wireless, USB)
- **EEPROM**—electrically erasable programmable read-only memory
  - used for firmware (part of data and software that usually is not changed, configuration data)
  - can not be easily overwritten in comparison to Flash
- **Flash memory**—non-volatile random-access memory for program and data

# High-Level Software View

- Use FreeRTOS which we will use in the labs of this course<sup>a</sup>
- Real-time tasks for motor control (gathering sensor values and pilot commands, sensor fusion, automatic control, driving motors using PWM (pulse width modulation, . . . ))
- non-real-time tasks (maintenance and test, handling external events, pilot commands, . . . ).
